Cylinder with Lock

New

Ø32, Ø40, Ø50, Ø63, Ø80, Ø100

RoHS

Lock can be manually operated with a hexagon wrench.

Hexagon wrench

Can be easily mounted onto equipment

The lock unit and the

cylinder can be separated. Improved ease of maintenance

Locked state

Holding force improved by 15% $(C(P)95N, Ø50: 1370 N \rightarrow C(P)96N: 1570 N)$

Overall length reduced by

27.5 mm max.

(Compared with a C(P)95N, Ø100, 100 mm stroke)

Lock Unit

Applicable rod size: ø12 to ø30

A locking cylinder ideal for intermediate stops,

- Built-in manual lock release holding mechanism
- It is possible to release the locked state with a hexagon wrench and hold the released state without pressurizing the unlock port.
- Simple construction

• The condition of the lock release bolt allows for visual confirmation of whether the cylinder is in a locked or manual lock released state.

Refer to page 52 for the manual lock release.

Overall length reduced by 27.5 mm max.

Up to 27.5 mm shorter compared with the C(P)95N series

| Overall lengtl | n reduced | | [mm] |

| 80 | 3920 | 3430 | 14 |
| 100 | 6080 | 5390 | 13 |

CP96N Series

emergency stops, and drop prevention

Part numbers for products with a rod end bracket and/or a pivot bracket are available.

Various mounting bracket options Mounting brackets can be combined according Axial foot (L) to the operating conditions. Axial foot (L) Rod end (KJ) Rod clevis (GKM) Rod flange (F) Floating joint CP96N Series (JA) Head flange (G) Double clevis (D) C96N Series Single clevis (C) Clevis pivot bracket (**E**) Single clevis (C) Double clevis pivot bracket (DS) Center trunnion (Only applicable to the C96N) Clevis pivot bracket with ball joint (ES)

Series Variations

Single clevis with ball joint (CS)

Single clevis with ball joint (CS)

Lock Unit

A safety mechanism can be designed if required. It can also be combined with a wide variety of actuators.

- Prevents the workpiece from falling
- Retains the workpiece position even when the air supply is shut off due to power failure, etc.

^{*1} The applicable rod size affects the holding force, so use a rod with the rod size tolerance shown in the table above.

Part numbers for lock units with an applicable rod are now available.

It is not necessary to order a rod for the lock unit separately.

* Rod is shipped together with the product.

^{*2} The holding force (max. static load) shows the maximum capability and does not show the normal holding capability. Be sure to select a cylinder using the method described in Model Selection (page 6).

Safety Instructions ------ Back cover

CP96N/C96N Series Model Selection

Precautions on Model Selection

⚠ Caution

- 1. In order that the originally selected maximum speed shall not be exceeded, be certain to use a speed controller to adjust the total movement distance of the load so that movement takes place in no less than the applicable movement time.
 - The movement time is the time that is necessary for the load to travel the total movement distance from the start without any intermediate stops.
- 2. In cases where the cylinder stroke and the movement distance of the load are different (double speed mechanism etc.), use the movement distance of the load for selection purposes.

3. The following selection example and procedures are based on use at the intermediate stop (including emergency stops during operation). However, when the cylinder is in a locked state, kinetic energy does not act upon it. Under these conditions, use the load mass at the maximum speed (V) of 100 mm/s shown in graphs 5 to 7 on page 7 depending on the operating pressure and select models.

Selection Example

Load mass : m = 50 kg
 Movement distance : st = 500 mm
 Movement time : t = 2 s

• Load condition : Vertical downward = Load in direction of

rod extension

• Operating pressure : $\mathbf{P} = 0.4 \text{ MPa}$

Step **1**: From graph 1, find the maximum movement speed of the load

∴ Maximum speed : $\mathbf{V} \approx 350$ mm/s.

Step 2: Select graph 6 (Refer to page 7.) based upon the load conditions and operating pressure, and then from the intersection of the maximum speed **V** = 350 mm/s found in Step 1, and the load mass **m** = 50 kg.

∴ \emptyset 63 → Select a C(P)96N63 or larger bore size.

Step Find the maximum load speed V.

Find the maximum load speed: V [mm/s] from the load movement time: t [s] and the movement distance: st [mm].

Step 2 Find the bore size.

Select a graph based upon the load condition and operating pressure, and then find the point of intersection for the maximum speed found in Step 11 and the load mass. Select the bore size on the above the point of intersection.

Load in the direction of rod extension Load in the direction of rod retraction

CP96N/C96N Series

Selection Graph

CP96N/C96N Series Working Principle

Normal Operation (Operation pressurized by air)

Unlocked (when air pressure is applied)

When air is supplied to the unlock port, the piston moves downward, the brake pad is opened by the tapered portion at the bottom of the piston and the piston rod will be free to move. This is the lock released state.

* Check that there is no air leakage from the unlock port.

Locked (when air is exhausted)

When the air supplied to the unlock port is exhausted, the piston moves upward due to the spring force at the bottom of the piston and rigidity of the brake pad. Then, the brake pad is closed and holds the piston rod, locking its movement. This is the locked state.

Manual Lock Release

Manual lock released

When the lock release bolt is screwed-in, the piston moves downward, the brake pad is opened by the tapered portion of the piston and the piston rod will be freed. This holds the lock in the released state. Refer to page 52 for how to return to the locked state.

- *1 Water-resistant type auto switches can be mounted on the above models, but SMC cannot guarantee water resistance.
- *2 The 1 m lead wire is only applicable to the D-A93.
- * Lead wire length symbols: 0.5 m Nil (Example) M9NW

1 m M (Example) M9NWM

3 m ······ L (Example) M9NWL

- 5 m \cdots Z (Example) M9NWZ
- $\ast\,$ Solid state auto switches marked with "O" are produced upon receipt of order.
- Since there are applicable auto switches other than those listed above, refer to page 23 for details.
- * The D-A9□/M9□/M9□W/M9□A auto switches are shipped together with the product but do not come assembled. (Only the auto switch mounting brackets are assembled before shipment.)
- * The D-Y59A, Y69A, Y7P, Y7□W, Z7□, Z80 cannot be mounted. Moreover, the D-M9□□ and A9□ auto switches cannot be mounted on square groove.

Cylinder Specifications

^{*1} Load limits exist depending upon the piston speed when locked, mounting direction, and operating pressure.

| | 32 40 50 63 80 | size Standard stroke 32 25, 50, 80, 100, 125, 160, 200, 250, 320, 400, 500 40 25, 50, 80, 100, 125, 160, 200, 250, 320, 400, 500 50 25, 50, 80, 100, 125, 160, 200, 250, 320, 400, 500, 600 63 25, 50, 80, 100, 125, 160, 200, 250, 320, 400, 500, 600 80 25, 50, 80, 100, 125, 160, 200, 250, 320, 400, 500, 600, 700, 800 |

- * The manufacturing of intermediate strokes is possible. (Spacers are not used.)
- Applicable strokes should be confirmed according to the usage. For details, refer to the Air Cylinders Model Selection in the **Web Catalog** or Best Pneumatics Catalog. In addition, products that exceed the standard stroke might not be able to fulfill the specifications due to deflection, etc.
- When using a rod boot, a stroke range of up to 1000 mm is available. Please consult with SMC when exceeding a 1000 mm stroke.

Stopping Accuracy

| J | Nylon tarpaulin | 70°C |
| K | Heat-resistant tarpaulin | 110°C* ¹ |

*1 Max. ambient temperature for rod boot itself

Allowable Kinetic Energy of the Cylinder*1

Example) Load limit at rod end when the air cylinder ø63 is actuated at 500 mm/s.

Extend upward from 500 mm/s on the horizontal axis of the graph to the intersection point with the line for a tube bore size of 63 mm, and then extend leftward from this point to find the load of 80 kg.

*1 The allowable kinetic energy of the cylinder is shown without the intermediate stop or emergency stop. Refer to page 6 or 7 for the kinetic energy with intermediate or emergency stop.

Calculation example)

CP96NL32-100C (Axial foot, ø32, 100 mm stroke)

- Basic weight…0.42 (Lock unit, ø32)
- Basic weight…0.55 (Cylinder, ø32)
- Additional weight ··· 0.14/50 mm stroke
- Cylinder stroke…100 mm stroke
- Foot bracket···0.16

 $0.42 + 0.55 + (0.14/50) \times 100 + 0.16 =$ **1.41 kg**

| Bore size [mm] | Kit no. | Contents |
|-------------------|------------|---------------------------------------------------|
| 32 | C96N32-PS | |
| 40 | C96N40-PS | A set of ⑦ Rod seal A, ④ Rod seal B, |
| 50 | C96N50-PS | 4) Piston seal B, |
| 63 | C96N63-PS | 42 Cushion seal A, |
| 80 | C96N80-PS | 43 Cushion seal B, and 45 Cylinder tube gasket |
| 100 | C96N100-PS | G Cymraer tabo gasket |

- * Never disassemble the lock unit. It should be replaced as a unit. Refer to page 52 for the part numbers for placing an order. The seal kit shown above contains the rod seal for the cylinder and lock unit. Order the seal kit suitable for the cylinder bore size.
- The seal kit shown above includes a grease pack. (ø32, ø40, ø50: 10 g, ø63, ø80: 20 g, ø100: 30 g)
 Order with the following part number when only the grease pack is needed.
 Grease pack part number: GR-S-010 (10 g), GR-S-020 (20 g)

Values which include hysteresis are for reference purposes only. They are not a guarantee (assuming approximately ±30% dispersion) and may change substantially depending on the ambient environment.

Other than the applicable auto switches listed in "How to Order," the following auto switches are also mountable.

- * Normally closed (NC = b contact) solid state auto switches (D-M9□E) are also available. For details, refer to the **Web Catalog** or Best Pneumatics Catalog.
- * With pre-wired connector is also available for solid state switches. For details, refer to the Web Catalog or Best Pneumatics Catalog.

^{*} The D-M9□V/M9□WV/M9□AV/A9□V are mountable on ø32 to ø63.

The D-M9□V/M9□WV/M9□AV/A9□V are mountable on ø32 to ø63.

Prior to Use Auto Switch Connections and Examples

Sink Input Specifications

Source Input Specifications

3-wire, PNP

Connect according to the applicable PLC input specifications, as the connection method will vary depending on the PLC input specifications.

Examples of AND (Series) and OR (Parallel) Connections

* When using solid state auto switches, ensure the application is set up so the signals for the first 50 ms are invalid.

3-wire AND connection for NPN output (Using relays)

(Performed with auto switches only)

3-wire OR connection for NPN output

3-wire AND connection for PNP output (Using relays)

3-wire OR connection for PNP output

(Reed)

2-wire AND connection

When two auto switches are connected in series, a load may malfunction because the load voltage will decline when in the ON state.

The indicator lights will light up when both of the auto switches are in the ON state. Auto switches with a load voltage less than 20 V cannot be used.

Load voltage at ON = Power supply voltage -Residual voltage x 2 pcs. = 24 V - 4 V x 2 pcs.

Example: Power supply is 24 VDC Internal voltage drop in auto switch is 4 V.

2-wire OR connection

(Solid state) When two auto switches are connected in parallel, malfunction may occur because the load voltage will increase when in the OFF state

Example: Load impedance is 3 kQ. Leakage current from auto switch is 1 mA. Because there is no current leakage, the load voltage will not increase when turned OFF However, depending on the number of auto switches in the ON state. the indicator lights may sometimes grow dim or not light up, due to the dispersion and reduction of the current flowing to the auto switches.

Load voltage at OFF = Leakage current x 2 pcs. x Load impedance = 1 mA x 2 pcs. x 3 k Ω

- *1 Water-resistant type auto switches can be mounted on the above models, but SMC cannot guarantee water resistance.
- A water-resistant type cylinder is recommended for use in an environment which requires water resistance.
- *2 The 1 m lead wire is only applicable to the D-A93.
- * Solid state auto switches marked with "O" are produced upon receipt of order.
- * Since there are applicable auto switches other than those listed above, refer to page 42 for details.
- * The D-A9□/M9□/P3DWA□ auto switches are shipped together with the product but do not come assembled. (Only the auto switch mounting brackets are assembled for the D-A9□/M9□ before shipment.)

| 80 | 25, 50, 80, 100, 125, 160, 200, 250, 320, 400, 500, 600, 700, 800 | 1900 |
| 100 | 25, 50, 80, 100, 125, 160, 200, 250, 320, 400, 500, 600, 700, 800 | 1900 |

- The manufacturing of intermediate strokes is possible. (Spacers are not used.)
- Applicable strokes should be confirmed according to the usage. For details, refer to the Air Cylinders Model Selection in the Web Catalog or Best Pneumatics Catalog. In addition, products that exceed the standard stroke might not be able to fulfill the specifications due to deflection, etc.
- When using a rod boot, a stroke range of up to 1000 mm is available. Please consult with SMC when exceeding a 1000 mm stroke.

Stopping Accuracy

| Bore size [mm] | 32 | 40 | 50 | 63 | 80 | 100 |

- *1 Order two foot brackets per cylinder.
- Accessories for each mounting bracket are as follows.
 Axial foot, Rod/Head flange, Single clevis: Body mounting bolt
 Double clevis (D, DS): Body mounting bolt, Clevis pin, Clevis pin bracket
- * The rod clevis (GKM) is compliant with ISO 8140.
- * The rod end (KJ) is compliant with ISO 8139.

Rod Boot Material

| Symbol | Material | Max. ambient temp. |
|--------|--------------------------|--------------------|
| J | Nylon tarpaulin | 70°C |
| K | Heat-resistant tarpaulin | 110°C*1 |

*1 Max. ambient temperature for rod boot itself

Allowable Kinetic Energy of the Cylinder*1

Example) Load limit at rod end when the air cylinder ø63 is actuated at 500 mm/s.

Extend upward from 500 mm/s on the horizontal axis of the graph to the intersection point with the line for a tube bore size of 63 mm, and then extend leftward from this point to find the load of 80 kg.

*1 The allowable kinetic energy of the cylinder is shown without the intermediate stop or emergency stop. Refer to page 6 or 7 for the kinetic energy with intermediate or emergency stop.

Calculation example)

C96NL32-100C (Axial foot, ø32, 100 mm stroke)

- Basic weight…0.42 (Lock unit, ø32)
- Basic weight…0.53 (Cylinder, ø32)
- Additional weight---0.11/50 mm stroke
- Cylinder stroke ··· 100 mm stroke
- Foot bracket--0.16

 $0.42 + 0.53 + (0.11/50) \times 100 + 0.16 =$ **1.33 kg**

13(8)(9)(1)(14)(2)(2) (3) (4) (15) (16) (6) (20) (10) (11) (18) (1) (40) (23) (45) (25) (28) (35) (41) (39) (37) (36) (31) (29) (24) 30 (44) 27 (43) 32 33 38 26 17 12 (34) ø**80**, ø**100**

- * Never disassemble the lock unit. It should be replaced as a unit. Refer to page 52 for the part numbers for placing an order. The seal kit shown above contains the rod seal for the cylinder and lock unit. Order the seal kit suitable for the cylinder bore size.
- The seal kit shown above includes a grease pack. (ø32, ø40, ø50: 10 g, ø63, ø80: 20 g, ø100: 30 g)
 Order with the following part number when only the grease pack is needed.
 Grease pack part number: GR-S-010 (10 g), GR-S-020 (20 g)

- * Never disassemble the lock unit. It should be replaced as a unit. Refer to page 52 for the part numbers for placing an order. The seal kit shown above contains the rod seal for the cylinder and lock unit. Order the seal kit suitable for the cylinder bore size.
- * The seal kit shown above includes a grease pack. (ø32, ø40, ø50: 10 g, ø63, ø80: 20 g, ø100: 30 g)
 Order with the following part number when only the grease pack is needed.
 Grease pack part number: GR-S-010 (10 g), GR-S-020 (20 g)

[Stainless Steel Mounting Screw]

The following stainless steel mounting screw kit (including set screws) is available. Use it in accordance with the operating environment. (Since the auto switch mounting bracket is not included, order it separately.)

BBA1: For D-A5/A6/F5/J5 types

* Refer to the Web Catalog or Best Pneumatics Catalog for details on the BBA1.

The above stainless steel screws are used when a cylinder is shipped with the D-F5BA auto switch. When only one auto switch is shipped independently, the BBA1 is attached.

* When using the D-M9□A(V) or Y7BA, do not use the steel set screws which are included with the auto switch mounting brackets above (BMB5-032, BA7-□□□, BMB4-□□□, BA4-□□□□).

Order a stainless steel screw kit (BBA1) separately, and use the M4 x 6 L stainless steel set screws included in the BBA1.

· The figure shows the mounting example for the D-M9□(V)/M9□W(V)/M9□A(V)/A9□(V).

pecific Product Precautions

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For actuator and auto switch precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Design of Equipment and Machinery

 Construct so that the human body will not come into direct contact with driven objects or the moving parts of the cylinders with lock.

Devise a safe structure by attaching protective covers that prevent direct contact with the human body, or in cases where there is a danger of contact, provide sensors or other devices to perform an emergency stop, etc., before contact occurs.

2. Use a balance circuit, taking cylinder lurching into consideration.

In cases such as an intermediate stop, where a lock is operated at a desired position within the stroke and air pressure is applied from only one side of the cylinder, the piston will lurch at high speed when the lock is released. In such situations, there is a danger of causing human injury by having hands or feet, etc. caught, and also a danger for causing damage to the equipment. In order to prevent this lurching, a balance circuit such as the recommended pneumatic circuits (page 51) should be used.

Selection

⚠ Warning

 When in the locked state, do not apply a load accompanied by an impact shock, strong vibration or turning force, etc.

Use caution, because an external action such as an impacting load, strong vibration or turning force, may damage the locking mechanism or reduce its life.

2. Consider stopping accuracy and the amount of overrun when an intermediate stop is performed.

Due to the nature of a mechanical lock, there is a momentary lag with respect to the stop signal, and a time delay occurs before stopping. The cylinder stroke resulting from this delay is the overrun amount. The difference between the maximum and minimum overrun amounts is the stopping accuracy.

- Place a limit switch before the desired stopping position, at a distance equal to the overrun amount.
- The limit switch must have a detection length (dog length) of the overrun amount + Ω .
- SMC's auto switches have operating ranges from 8 to 14 mm (depending on the auto switch model).

When the overrun amount exceeds this range, self-holding of the contact should be performed at the auto switch load side.

* For the stopping accuracy, refer to pages 10 and 26.

Selection

Marning

3. In order to further improve stopping accuracy, the time from the stop signal to the operation of the lock should be shortened as much as possible.

To accomplish this, use a device such as a highly responsive electric control circuit or solenoid valve, and place the solenoid valve as close as possible to the cylinder.

4. Note that the stopping accuracy will be influenced by changes in piston speed.

When piston speed changes during the course of the cylinder stroke due to variations in the load or disturbances, etc., the dispersion of stopping positions will increase. Therefore, consideration should be given to establishing a standard speed for the piston just before it reaches the stopping position.

Moreover, the dispersion of stopping positions will increase during the cushioned portion of the stroke and during the accelerating portion of the stroke after the start of operation, due to the large changes in piston speed.

5. The holding force (max. static load) indicates the maximum capability to hold a static load without loads, vibration and impact. This does not indicate a load that can be held in ordinary conditions.

Select the most suitable bore sizes for the operating conditions in accordance with the selection procedures. The Model Selection (pages 6 and 7) is based on use at the intermediate stop (including emergency stops during operation). However, when the cylinder is in a locked state, kinetic energy does not act upon it. Under these conditions, use the load mass at the maximum speed (V) of 100 mm/s shown in graphs 5 to 7 on page 7 depending on the operating pressure and select models.

Mounting

Marning

- The manual lock is released as default. The lock will not operate in this condition. Before starting operation, engage the lock.
- 2. Be certain to connect the rod end to the load with the lock released.

If connected in the locked state, a load greater than the turning force or holding force, etc. may operate on the piston rod and cause damage to the lock mechanism. As the C(P)96N series is equipped with a manual lock release mechanism, it is possible to hold the lock released state without an air supply.

3. Do not apply offset loads to the piston rod.

Particular care should be taken to match the load's center of gravity with the center of the cylinder shaft. When there is a large discrepancy, the piston rod may be subjected to uneven wear or damage due to the inertial moment during locking stops.

* Can be used if all of the generated moment is absorbed by an effective guide.

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For actuator and auto switch precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Auto Switch Accessories

Specific Produc Precautions

Mounting

⚠ Caution

 Use the hexagon wrenches shown below when replacing brackets.

| Bore size [mm] | Width across flats | Tightening torque [N·m] |
|----------------|--------------------|-------------------------|
| 32, 40 | 4 | 4.8 |
| 50, 63 | 5 | 10.4 |
| 80, 100 | 6 | 18.2 |

2. When replacing the head side bracket, the tie-rod nut on the cylinder body also loosens.

After retightening the tie-rod nut at the proper tightening torque (refer to the Mounting 1. above.), install the bracket.

Do not turn the piston rod with the rod boot kept locked.

When turning the piston rod, loosen the band once and do not twist the rod boot.

Set the breathing hole in the rod boot downward or in the direction that prevents entry of dust or water content.

Do not disassemble the trunnion type cylinder because the mounting precision is required.

It is difficult to align the axial center of the trunnion with the axial center of the cylinder. Thus, if this type of cylinder is disassembled and reassembled, the required dimensional accuracy cannot be attained, which may lead to malfunctions.

Adjustment

Marning

1. Do not open the cushion valve more than the allowable number of rotations (table on the right).

Although the cushion valve is caulked as a retaining mechanism, do not open the cushion valve more than the allowable number of rotations. If air is supplied and operation started without confirming the above condition, the cushion valve may be ejected from the cover.

The allowable number of rotations refers to the number of rotations until the restrictor of the cushion valve is completely opened from the completely closed state.

Adjustment

⚠ Warning

2. Keep the screwing torque and the unscrewing torque of the cushion valve to the allowable torque or below (following table).

If a screwing torque or unscrewing torque beyond the allowable torque is applied, the valve will be damaged when the valve is closed completely or exceeds the retaining mechanism when the valve is opened completely, which will dislocate the engagement of the screw and eject the valve.

| Bore size [mm] | Cushion valve width across flats | | Allowable number of rotations | Allowable torque [N·m] |
|-------------------|----------------------------------|----------------------------------|-------------------------------|------------------------|
| 32, 40 | 2 | JIS 4648 Hexagon wrench key 2 | 4 | 0.02 |
| 50, 63 | 2 | JIS 4648 Hexagon wrench key 2 | 4.5 | 0.02 |
| 80, 100 | 3 | JIS 4648 Hexagon wrench key 3 | 5.5 | 0.06 |

3. Be certain to activate the air cushion at the stroke end.

When the air cushion is inactivated, if the allowable kinetic energy exceeds the value on pages 11 and 27, the piston rod assembly or the tie-rod may be damaged. Set the air cushion to valid when operating the cylinder.

⚠ Caution

1. Adjust the cylinder's air balance.

Balance the load by adjusting the air pressure in the rod and head sides of the cylinder with the load connected to the cylinder and the lock released. Lurching of the cylinder when unlocked can be prevented by carefully adjusting this air balance.

2. Adjust the mounting positions of the detectors on auto switches, etc.

When intermediate stops are to be performed, adjust the mounting positions of detectors on auto switches, etc., taking into consideration the overrun amount with respect to the desired stopping positions.

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For actuator and auto switch precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Pneumatic Circuit

∕ Warning

- 1. Be certain to use a pneumatic circuit which will apply balancing pressure to both sides of the piston when in a locked stop. In order to prevent cylinder lurching after a lock stop, when restarting or when manually unlocking, a circuit should be used to which will apply balancing pressure to both sides of the piston, thereby canceling the force generated by the load in the direction of piston movement.
- 2. The effective area of the unlocking solenoid valve should be at least 50% of the effective area of the cylinder driving solenoid valve, and it should be installed as close to the cylinder as possible so that it is closer than the cylinder driving solenoid valve.

If the effective area of the unlocking solenoid valve is small or if it is installed at a distance from the cylinder, the time required for exhausting air for unlocking will be longer, which may cause a delay in the locking operation.

The delay in the locking operation may result in problems such as increase of overrunning when performing intermediate stop or emergency stop during operation, or if maintaining position from the operation stop state such as drop prevention, workpieces may be dropped depending on the timing of the load action to the operation delay of the lock.

3. Avoid backflow of the exhaust pressure when there is a possibility of interference of exhaust air, for example for a common exhaust type valve manifold.

The lock may not operate properly when the exhaust air pressure backflows due to interference of the exhaust air when exhausting air for lock release. It is recommended to use an individual exhaust type manifold or individual valves.

4. Allow at least 0.5 seconds from a locked stop (intermediate stop of the cylinder) until release of the lock. When the locked stop time is too short, the piston rod (and

load) may lurch at a speed greater than the control speed of the speed controller.

5. When restarting, control the switching signal for the unlocking solenoid valve so that it acts before or at the same time as the cylinder drive solenoid valve.

If the signal is delayed, the piston rod (and load) may lurch at a speed greater than the control speed of the speed controller.

6. Carefully check for dew condensation due to repeated air supply and exhaust of the locking solenoid valve.

The operating stroke of the lock part is very small. So, if the piping is long and the air supply and exhaust are repeated. the dew condensation caused by the adiabatic expansion accumulates in the lock part. This may corrode internal parts, causing air leak or lock release fault.

⚠ Warning

7. Basic circuit

2. [Vertical]

[Load in the direction of rod extension]

♠ Caution

1. 3-position pressure center solenoid valve and regulator with backflow function can be replaced with two 3-port normally open valves and a regulator with relief function.

[Example]

1. [Horizontal]

2. [Vertical]

[Load in the direction of rod extension]

[Load in the direction of rod retraction]

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For actuator and auto switch precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Made to

Specific Product Precautions

Manual Lock Release

- Never operate the lock release bolt until safety has been confirmed.
 - When unlocking is performed with air pressure applied to only one side of the cylinder, the moving parts of the cylinder will lurch at high speed causing a serious hazard.
 - When unlocking is performed, be sure to confirm that personnel are not within the load movement range and that no other problems will occur if the load moves.
- 2. Before operating the lock release bolt, exhaust any residual pressure which is in the system.
- 3. Take measures to prevent the load from dropping.
 - Perform work with the load in its lowest position.
 - Take measures for drop prevention by strut, etc.

⚠ Caution

 When releasing the locked state with the lock release bolt for the purpose of mounting or adjustment, be sure to return the lock release bolt to the locked state.

If the lock release bolt is not returned to the locked state, the lock might not function correctly or lock release might not be completed due to air leakage from the lock release bolt.

[How to return to locked state]

- Rotate the lock release bolt counterclockwise by hand with a hexagon wrench until it stops. Once that position is reached, rotate it an additional 1/6th of a turn to securely tighten the lock release bolt.
 - * Do not use an electric screwdriver or pneumatic screwdriver.

Manual lock released

Locked

| Bore size [mm] | Hexagon wrench size of the lock release bolt |
|-------------------|----------------------------------------------|
| 32, 40 | 3 |
| 50, 63 | 4 |
| 80, 100 | 5 |
| | |

2) Pressurize the unlock port with 0.3 MPa or more and check that there is no air leakage from the lock release bolt and lock correctly functions.

Maintenance

⚠ Caution

1. Lock units are replaceable.

When ordering the lock unit for maintenance, select the suitable lock based on the cylinder bore size.

| Bore size [mm] | Port type | Replacement lock unit part no. |
|----------------|-----------|--------------------------------|
| 32 | G | MWB32TF-UA |
| 40 | G | MWB40TF-UA |
| 50 | G | MWB50TF-UA |
| 63 | G | MWB63TF-UA |
| 80 | G | MWB80TF-UA |
| 100 | G | MWB100TF-UA |

For lock unit with a rod boot, add –J to the part number suffix.
 Example) MWB50TF-UA-J

2. How to replace lock units

The following method is described using CP96N, however, it can equally be applied to the C96N.

 To release the locked state, screw-in the lock release bolt to the body cap end or pressurize the unlock port with 0.3 MPa or more.

 a) Lock released by air pressure b) Manual lock release

Remove the lock unit holding bolt (hexagon socket head cap screw) with a hexagon wrench. For the applicable hexagon wrench, refer to the table below.

If using the rod end nut, remove it.

| Bore size [mm] | Hexagon wrench size of the lock unit holding bolt |
|-------------------|---------------------------------------------------|
| 32 | 3 |
| 40, 50 | 5 |
| 63 | 6 |
| 80 | 8 |
| 100 | 10 |

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For actuator and auto switch precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Maintenance

⚠ Caution

3) Pull out the old lock unit from the cylinder.

4) Insert a new lock unit into the cylinder. The lock unit for maintenance is supplied with lock released state at the shipment from the factory.

5) Insert the lock unit holding bolt and tighten it temporarily.

Check that the piston rod operates smoothly by hand while maintaining the lock released state.

6) Confirm that the operation of 5) is performed correctly, and then tighten the lock unit holding bolt with an appropriate tightening torque as shown in the table below.

| Bore size Appropriate tightening torque the lock unit holding bolt [N- | |
|------------------------------------------------------------------------|--------------|
| 32 | 1.35 to 1.65 |
| 40, 50 | 4.7 to 5.7 |
| 63 | 11.3 to 13.7 |
| 80 | 22.1 to 26.9 |
| 100 | 37.8 to 46.2 |

- 7) After assembly is completed, rotate the lock release bolt counterclockwise by hand with a hexagon wrench until it stops. Once that position is reached, rotate it for an additional 1/6th of a turn to securely tighten the lock release bolt.
 - * Do not use an electric screwdriver or pneumatic screwdriver.

| Bore size [mm] | Hexagon wrench size of the lock release bolt |
|-------------------|----------------------------------------------|
| 32, 40 | 3 |
| 50, 63 | 4 |
| 80, 100 | 5 |

Check that the cylinder is locked and confirm that the lock is released when air pressure of 0.3 MPa or more is applied to the unlock port on the lock unit. In addition to this, the piston rod should operate smoothly with the minimum operating pressure. Check that there is no air leakage from the lock release bolt.

MWB□-UT Series Specific Product Precautions

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For actuator and auto switch precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

<Pre><Pre>cautions for the lock unit MWB□-UT>

Design / Selection

- When selecting a lock unit, refer to Model Selection on pages 6 and 7.
- Use a rod of the size recommended in the following table.

| Unit model | MWB32-UT | MWB40-UT | MWB50-UT | MWB63-UT | MWB80-UT | MWB100-UT | | | |
|---------------------|--------------------------------|----------|----------|----------|----------|-----------|--|--|--|
| Applicable rod size | ø12 f8 | ø16 f8 | ø20 f8 | ø20 f8 | ø25 f8 | ø30 f8 | | | |
| Material | Carbon steel/Stainless steel | | | | | | | | |
| Surface treatment | Hard chrome plating: 10 μm | | | | | | | | |
| Surface roughness | Maximum height: Rz 1.6 or less | | | | | | | | |

Using any rod other than the rods recommended above may cause damage to internal parts of the lock unit, faulty mounting of the lock unit, operation failure, decrease in holding force, etc.

- The lock unit may be damaged if an excessive lateral load or external force is applied to it. Fully consider this point.
- Do not use the lock unit for any application where the rod rotates.
- When in the locked state, do not apply a load accompanied by an impact shock, strong vibration, turning force, etc.

Note that an external action, such as an impacting load, strong vibration, or turning force, may damage the lock unit or reduce its life.

- Excessively long piping between the unlock port of the lock unit and the solenoid valve for the lock, or a pipe that is too small may affect the stopping accuracy of the lock unit.
- When unlocking is performed from the locked state with some thrust or load still applied to the lock unit, cylinder lurching may occur. In addition, frequent occurrence of excessive cylinder lurching or a similar problem due to the load being applied will damage the lock unit or reduce its life. Take appropriate measures for the circuit and/or the system. When using the lock unit in combination with a pneumatic cylinder, cylinder lurching can be prevented by using a balance circuit, such as the recommended pneumatic circuits on page 51.
- When using the lock unit by placing it in parallel with the cylinder for driving as shown in the figure below, align the cylinder with the rod.

多SMC

Mounting / Adjustment

 Ensure that the sliding surface of the rod to be inserted into the lock unit is not scratched or dented during the mounting or adjustment of this product.

Scratches or dents on the surface of the rod may cause unusual wear on the inner surface of the brake pad or decrease its holding force.

 Chamfer the rod end to be inserted into the lock unit as shown in the figures below to prevent the seal and inner periphery of the lock unit from being scratched.

• Refer to page 52 for the manual lock release.

Maintenance / Inspection

Do not disassemble the lock unit and perform maintenance.

Please contact our nearest sales office when you require repair or maintenance.

Do not apply any grease or lubricant to the inner periphery of the lock unit or the surface of the rod to be inserted into the lock unit.

Doing so may result in a decrease in holding force.

• Take additional safety measures when conducting equipment maintenance.

54

⚠ Safety Instructions

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of "Caution," "Warning" or "Danger." They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)*1), and other safety regulations. -----

Caution: Caution indicates a hazard with a low level of risk which, If not avoided, could result in minor or moderate injury.

Warning: Warning indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.

⚠ Danger: Danger indicates a nazaru wiun a nigin level on the first avoided, will result in death or serious injury. **Danger** indicates a hazard with a high level of risk which, *1) ISO 4414: Pneumatic fluid power - General rules relating to systems.

ISO 4413: Hydraulic fluid power – General rules relating to systems.

IEC 60204-1: Safety of machinery - Electrical equipment of machines. (Part 1: General requirements)

ISO 10218-1: Manipulating industrial robots - Safety.

⚠Warning

1. The compatibility of the product is the responsibility of the person who designs the equipment or decides its specifications.

Since the product specified here is used under various operating conditions, its compatibility with specific equipment must be decided by the person who designs the equipment or decides its specifications based on necessary analysis and test results. The expected performance and safety assurance of the equipment will be the responsibility of the person who has determined its compatibility with the product. This person should also continuously review all specifications of the product referring to its latest catalog information, with a view to giving due consideration to any possibility of equipment failure when configuring the equipment.

2. Only personnel with appropriate training should operate machinery and equipment.

The product specified here may become unsafe if handled incorrectly. The assembly, operation and maintenance of machines or equipment including our products must be performed by an operator who is appropriately trained and experienced.

3. Do not service or attempt to remove product and machinery/ equipment until safety is confirmed.

- 1. The inspection and maintenance of machinery/equipment should only be performed after measures to prevent falling or runaway of the driven objects have been confirmed.
- 2. When the product is to be removed, confirm that the safety measures as mentioned above are implemented and the power from any appropriate source is cut, and read and understand the specific product precautions of all relevant products carefully.
- 3. Before machinery/equipment is restarted, take measures to prevent unexpected operation and malfunction.
- 4. Contact SMC beforehand and take special consideration of safety measures if the product is to be used in any of the following conditions.
 - 1. Conditions and environments outside of the given specifications, or use outdoors or in a place exposed to direct sunlight.
 - 2. Installation on equipment in conjunction with atomic energy, railways, air navigation, space, shipping, vehicles, military, medical treatment, combustion and recreation, or equipment in contact with food and beverages, emergency stop circuits, clutch and brake circuits in press applications, safety equipment or other applications unsuitable for the standard specifications described in the product catalog.
 - 3. An application which could have negative effects on people, property, or animals requiring special safety analysis.
 - 4. Use in an interlock circuit, which requires the provision of double interlock for possible failure by using a mechanical protective function, and periodical checks to confirm proper operation.

⚠ Caution

1. The product is provided for use in manufacturing industries.

The product herein described is basically provided for peaceful use in manufacturing industries.

If considering using the product in other industries, consult SMC beforehand and exchange specifications or a contract if necessary.

If anything is unclear, contact your nearest sales branch.

Limited warranty and Disclaimer/ **Compliance Requirements**

The product used is subject to the following "Limited warranty and Disclaimer" and "Compliance Requirements".

Read and accept them before using the product.

Limited warranty and Disclaimer

- 1. The warranty period of the product is 1 year in service or 1.5 years after the product is delivered, whichever is first.*2) Also, the product may have specified durability, running distance or
 - replacement parts. Please consult your nearest sales branch.
- 2. For any failure or damage reported within the warranty period which is clearly our responsibility, a replacement product or necessary parts will be provided. This limited warranty applies only to our product independently, and not to any other damage incurred due to the failure of the product.
- 3. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.
 - 2) Vacuum pads are excluded from this 1 year warranty.

A vacuum pad is a consumable part, so it is warranted for a year after it is delivered.

Also, even within the warranty period, the wear of a product due to the use of the vacuum pad or failure due to the deterioration of rubber material are not covered by the limited warranty.

Compliance Requirements

- 1. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited.
- 2. The exports of SMC products or technology from one country to another are governed by the relevant security laws and regulations of the countries involved in the transaction. Prior to the shipment of a SMC product to another country, assure that all local rules governing that export are known and followed.

⚠ Caution

SMC products are not intended for use as instruments for legal metrology.

Measurement instruments that SMC manufactures or sells have not been qualified by type approval tests relevant to the metrology (measurement) laws of each country. Therefore, SMC products cannot be used for business or certification ordained by the metrology (measurement) laws of each country.

Cylinder with Lock: With Lock Status Indication

Ø32, Ø40, Ø50, Ø63, Ø80, Ø100

Safety Measure

Whether the cylinder is in a locked or manual lock released state can be visually confirmed at a glance.

The high visibility of the lock released state indication label allows for easy confirmation of the lock released state, even from a distance.

Available with a cap nut

Prevents the adhesion of spatter, foreign matter, etc.

How to Order

With lock status indication

| С | With coil scraper |

C96N specifications

| Bore size | 32 | 40 | 50 | 63 | 80 | 100 | | |
|-------------------------------------|---------------------------|----|----|----|----|-----|--|--|
| Rod boot | None | | | | | | | |
| Specifications other than the above | Same as the standard type | | | | | | | |

ø32

C96N lock unit specifications: The same as those of the standard C96N-UT series model

The dimensions are the same as those of the standard C96N and C96N-UT series models.

The CP96N is not supported.

Changing from the manual lock released state to the locked state

Turn the lock release bolt counterclockwise.

1. Continue to turn the bolt counterclockwise until the groove in the middle of the lock release bolt is completely above the body surface.

2 Align the groove and the locked state indication plate.

1. Insert the locked state indication plate into the groove in the bolt and align the orientation marks until the lock released state indication label (yellow) is no longer visible.

If the bolt is not sufficiently turned counterclockwise, the groove position will not be aligned and the locked state indication plate cannot be inserted.

3 Secure the locked state indication plate.

- 1. Continue to turn the lock release bolt counterclockwise.
- 2. The locked state indication plate will move upward, securing it.
- 3. Confirm that the locked state indication plate does not move.

When the locked state indication plate is secured, the end of the plate will be lifted slightly.

∆ Caution

■ Before operating the cylinder, be sure to first carry out a test operation to check for operation abnormalities as stated in the precautions in the C(P)96N Series Operation Manual on the SMC website.
