Performance Curve: Automatically Operated Type

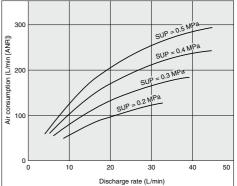

PAF5410 Flow Rate Characteristics

PAF5410 Air Consumption

Selection from Flow Characteristic Graph (PAF3410)

Required specifications example:

Find the pilot air pressure and pilot air consumption for a discharge rate of 6 L/min and discharge pressure of 0.25 MPa. <The transfer fluid is fresh water (viscosity 1 mPa s, specific gravity 1.0).>

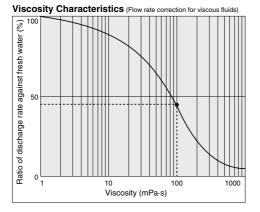

* If the total lifting height is required instead of the discharge pressure, discharge pressure of 0.1 MPa corresponds to a total lift of 10 m.

Selection procedures:

- 1. First mark the intersection point for a discharge rate of 6 L/min and discharge pressure of 0.25 MPa.
- 2. Find the pilot air pressure for the marked point. In this case, the point is between the discharge curves for SUP = 0.3 MPa and SUP = 0.4 MPa, and based on the proportional relationship to these lines, the pilot air pressure for this point is approximately 0.35 MPa.
- Next find the air consumption rate. Trace the discharge rate, 6 L/min, up to the point between the discharge curves for SUP = 0.3 MPa and 0.4 MPa, then trace to the Y-axis, finding the air consumption to be around 55 L/min (ANR).

A Caution

- 1. These flow rate characteristics are for fresh water (viscosity 1 mPa·s, specific gravity 1.0).
- The discharge rate differs greatly depending on properties (viscosity, specific gravity) of the fluid being transferred and operating conditions (lifting range, transfer distance), etc.
- 3. Use 0.75 kW per 100 L/min of air consumption as a guide for the relationship of the air consumption to the compressor.

Selection from Viscosity Characteristic Graph

Required specifications example:

Find the pilot air pressure and pilot air consumption for a discharge rate of 2.7 L/min, discharge pressure of 0.25 MPa, and a viscosity of 100 mPa-s.

Selection procedures:

- First find the ratio of the discharge rate for fresh water when viscosity is 100 mPa s from the graph below. It is determined to be 45%.
- 2. Next, in the required specification example, the viscosity is 100 mPa-s and the discharge rate is 2.7 L/min. Since this is equivalent to 45% of the discharge rate for fresh water, 2.7 L/min ÷ 0.45 = 6 L/min, indicating that a discharge rate of 6 L/min is required for fresh water.
- Finally, find the pilot air pressure and pilot air consumption based on selection from the flow characteristic graphs.

A Caution

Viscosities up to 1000 mPa $\cdot s$ can be used.

Dynamic viscosity ν= Viscosity μ/Density ρ.

 $v = \frac{\mu}{\rho}$

 $v(10^{-3} \text{ m}^2/\text{s}) = \mu(\text{mPa}\cdot\text{s})/\rho(\text{kg/m}^3)$

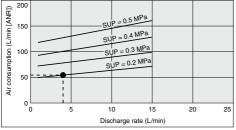

Performance Curve: Air Operated Type

PAF

Selection from Flow Rate Characteristic Graph (PAF3413)

Required specification example:

Find the pilot air pressure and pilot air consumption for a discharge rate of 4 L/min and discharge pressure of 0.15 MPa. < The transfer fluid is fresh water (viscosity 1 mPa·s, specific gravity 1.0).>

Note 1) If the total lifting height is required instead of the discharge pressure, discharge pressure of 0.1 MPa corresponds to a total lift of 10 m. Note 2) Discharge per cycle: Approx. 50 mL

Selection procedures:

- 1. First mark the intersection point for a discharge rate of 4 L/min and discharge pressure of 0.15 MPa.
- 2. Find the pilot air pressure for the marked point. In this case, the point is between the discharge curves (solid lines) for SUP = 0.2 MPa, and the pilot air pressure for this point is approx. 0.2 MPa. PAX

Calculating Air Consumption (PAF3413)

Find the air consumption for operation with a discharge rate of 4 L/min, a 4 Hz switching cycle and pilot air pressure of 0.2 MPa from the air consumption graph. PA□ PB

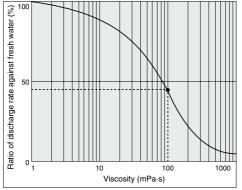

Selection procedures:

- 1. Look up from the discharge rate of 4 L/min to find the intersection with SUP = 0.2 MPa.
- 2. From the point just found, draw a line to the Y-axis to find the air consumption. The result is approximately 54 L/min (ANR).

A Caution

- 1. These flow rate characteristics are for fresh water (viscosity 1 mPa·s, specific gravity 1.0).
- 2. The discharge rate differs greatly depending on properties (viscosity, specific gravity) of the fluid being transferred and operating conditions (density, lifting range, transfer distance).

Viscosity Characteristics (Flow rate correction for viscous fluids)

Selection from Viscosity Characteristic Graph

Required specification example:

Find the pilot air pressure and pilot air consumption for a discharge rate of 2.7 L/min, discharge pressure of 0.25 MPa, and a viscosity of 100 mPa.s.

Selection procedures:

- 1. First find the ratio of the discharge rate for fresh water when viscosity is 100 mPa s from the graph below. It is determined to be 45%
- 2. Next, in the required specification example, the viscosity is 100 mPa-s and the discharge rate is 2.7 L/min. Since this is equivalent to 45% of the discharge rate for fresh water, 2.7 L/min ÷ 0.45 = 6 L/min, indicating that a discharge rate of 6 L/min is required for fresh water.
- 3. Finally, find the pilot air pressure based on selection from the flow characteristic graphs.

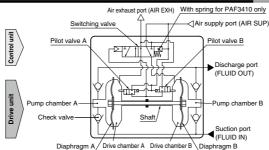

A Caution

Viscosities up to 1000 mPa-s can be used. Dynamic viscosity v = Viscosity u/Density p.

 $v = \frac{\mu}{0}$

 $v(10^{-3} \text{ m}^2/\text{s}) = \mu(\text{mPa}\cdot\text{s})/\rho(\text{kg/m}^3)$

Working Principle: Automatically Operated Type (PAF3410, 5410)

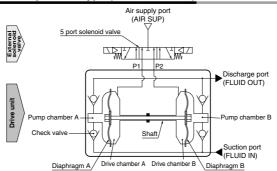

Control unit

- 1. When air is supplied, it passes through the switching valve and enters drive chamber B.
- 2. Diaphragm B moves to the right, and at the same time diaphragm A also moves to the right pushing pilot valve A.
- 3. When pilot valve A is pushed, air acts upon the switching valve, drive chamber A switches to a supply state, and the air which was in drive chamber B is exhausted to the cuthide
- drive chamber B is exhausted to the outside.
- 4. When air enters drive chamber A, diaphragm B moves to the left pushing pilot valve B.
- 5. When pilot valve B is pushed, the air which was acting upon the switching valve is exhausted, and drive chamber B once again switches to a supply state. A continuous reciprocal motion is generated by this repetition.

Drive unit

- 1. When air enters drive chamber B, the fluid in pump chamber B is forced out, and at the same time fluid is sucked into pump chamber A.
- 2. When the diaphragm moves in the opposite direction, the fluid in pump chamber A is forced out, and fluid is sucked into pump chamber B.
- 3. Continuous suction and discharge is performed by the reciprocal motion of the diaphragm.

Working Principle: Air Operated Type (PAF3413, 5413)

- 1. When air is supplied to P1 port, it enters drive chamber A.
- 2. Diaphragm A moves to the left, and at the same time diaphragm B also moves to the left.
- 3. The fluid in pump chamber A is forced out to the discharge port, and the fluid is sucked into pump chamber B from the suction port.
- If air is supplied to the P2 port, the opposite will occur. Continuous suction and discharge of fluid is performed by repeating this
 process with the control of an external solenoid valve (5 port valve).

Maintenance Parts

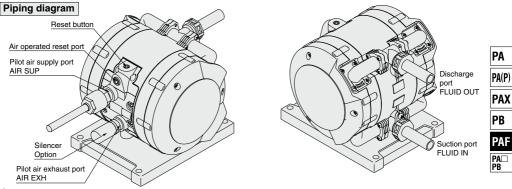

•While it is not possible to disassemble this product without voiding the warranty, if disassembly is to be carried out anyway due to necessity, be sure to follow the maintenance procedures.
 •When carrying out this work, wear appropriate protective equipment.

- ote) One of Nil, F or N is entered as thread symbol.

Piping and Operation: Automatically Operated Type (PAF3410, 5410)

∧ Caution

Mounting posture of the pump is set with the mounting bracket facing downward. Air to be supplied to the air supply port <AIR SUP> should be cleaned and filtered through a filter, or a mist separator etc. Air with foreign matter or drainage etc. will have negative effects on the built-in solenoid valve and will lead to malfunction.

Maintain the proper tightening torgue for fittings and mounting bolts, etc. Looseness can cause problems such as fluid and air leaks, while over tightening can cause damage to threads and parts, etc.

Operation

<Starting and Stopping> Refer to circuit example (1)

- 1. Connect air piping to the air supply port <AIR SUP> and connect piping for the fluid to be transfered to the suction port <FLUID IN> and the discharge port <FLUID OUT>.
- 2. Using a regulator, set the pilot air pressure within the range of 0.2 to 0.5 MPa. Then, the pump operates when power is applied to the 3 port solenoid valve of the air supply port <AIR SUP>, the sound of exhaust begins from the air exhaust port <AIR EXH> and fluid flows from the suction port <FLUID IN> to the discharge port <FLUID OUT>.
- At this time, the throttle on the discharge side is in an open state. The pump performs suction with its own power even without priming. (Dry state suction lifting range: max. 1 m) To restrict exhaust noise, attach a silencer (AN20-02: option) to the air exhaust port <AIR EXH>. 3. To stop the pump, exhaust the air pressure being supplied to the pump by the 3 port solenoid valve of the air supply port <AIR
- SUP>. The pump stops even when the throttle on the discharge side is closed. But the pressure supply to the pump should be exhausted quickly. <Discharge Flow Rate Adjustment>

- 1. To adjust the flow rate from the discharge port <FLUID OUT>, use the throttle connected to the discharge side. Refer to circuit example (1). Note that this product cannot be used as a fixed quantity liquid dispense pump.
- 2. When operating with a discharge flow rate below the specification range, provide a by-pass circuit from the discharge side to the suction side to ensure the minimum flow rate inside the process pump. With a discharge flow rate below the minimum flow rate, the process pump may stop due to unstable operation. Refer to circuit example (2). (Minimum flow rates: PAF3000 1 L/min, PAF5000 5 L/min) <Reset Button>

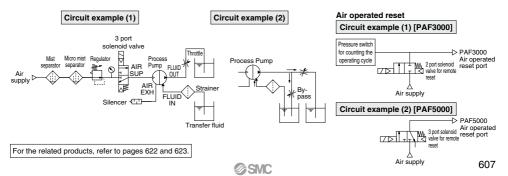

When the pump stops during operation, press the reset button. This makes it possible to restore operation in case the switching valve be-comes clogged due to foreign matter in the supply air.

<Air Operated Reset Port>

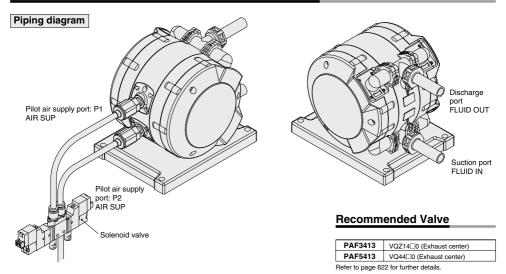

It is possible to restore operation by supplying air to the air operated reset port without directly pressing the reset button, such as by remote control. Pressure equivalent to or greater than pilot air pressure (but less than 0.5 MPa) is required to reset air. Refer to air operated reset circuit example (1) and (2)

<Counting The Operating Cycle: PAF3000 Only>

The pump's operating cycle can be counted by applying a pressure switch to the air operated reset port. Keep the distance between the pressure switch and the air operated reset port within 50 mm. Refer to air operated reset circuit example (1).

Piping and Operation: Air Operated Type (PAF3413, 5413)

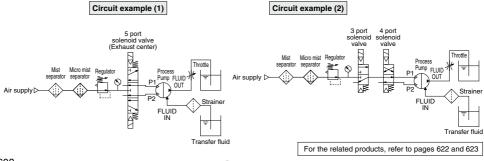

\land Caution

Maintain the proper tightening torque for fittings and mounting bolts, etc. Looseness can cause problems such as fluid and air leaks, while over tightening can cause damage to threads and parts, etc.

Operation

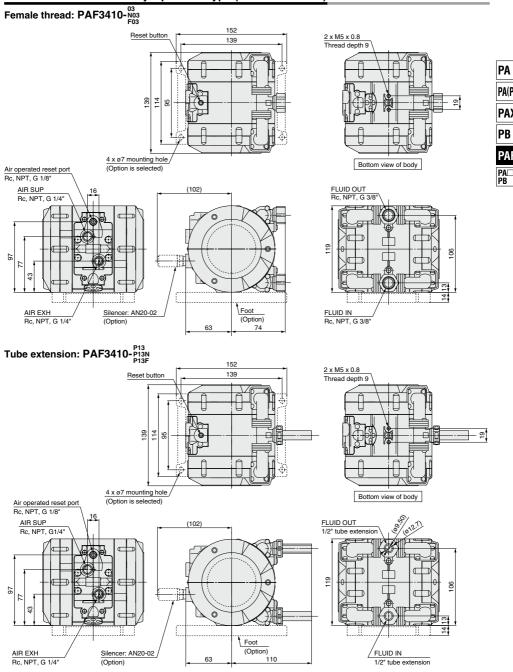

<Starting and Stopping> Refer to circuit example

- 1. Connect air piping Note 11 to the pilot air supply port <P1>, <P2> and connect piping for the fluid to be transfered to the suction port <FLUID IN> and the discharge port <FLUID OUT>.
- 2. Using a regulator, set the pilot air pressure within the range of 0.2 to 0.5 MPa. Then, the pump operates when power is applied to the solenoid valve Note²) of the pilot air supply port and fluid flows from the suction port <FLUID IN> to the discharge port <FLUID OUT>. At this time, the throttle on the discharge side is in an open state. The pump performs suction with its own power even without priming. Note³) (Dry state suction lifting range: Max. 1 m) To restrict exhaust noise, attach a silencer to the solenoid valve air exhaust port.
- 3. To stop the pump, exhaust the air pressure being supplied to the pump with the solenoid valve of the air supply port.
- Note 1) When used for highly permeable fluids, the solenoid valve may malfunction due to the gas contained in the exhaust. Implement measures to keep the exhaust from going to the solenoid valve side.
- Note 2) For the solenoid valve, use an exhaust center 5 port valve, or a combination of residual exhaust 3 port valve and a pump drive 4 port valve. If air in the drive chamber is not released when the pump is stopped, the diaphragm will be subjected to pressure and its life will be shortened.
- Note 3) When the pump is dry, operate the solenoid valve at a switching cycle of 2 to 4 Hz for PAF3000, 1 to 3 Hz for PAF5000. If operated outside of this range, the suction lifting height may not reach the prescribed value.
- <Discharge Flow Rate Adjustment>
- 1. The flow rate from the discharge port <FLUID OUT> can be adjusted easily by changing the switching cycle of the solenoid valve on the air supply port.

▲Caution

- 1. Select the wetted parts material in accordance with the transfer liquid for determing the model.
- Do not use fluid which corrode the wetted parts material. 2. Do not use the products for medical or food applications.
- 3. The applicability may vary depending on additives. Take note also of additives.
- 4. The applicability may vary depending on impurities. Take note also of impurities.
- Examples of transfer liquids are shown in the table on the left. Since the applicability may vary depending on your operating conditions, be sure to check it by means of experimentation.
- The compatibility shown in the table is when the fluid temperature is within the product specification (90°C or less).
- Note 1) Static electricity may be generated. Take measures to prevent static electricity.
- Note 2) Fluid may permeate through and affect parts made of other materials.
