## Vacuum Ejector With Solid State Timer <br> Series ZMA

Incorporates solid state timer function for release valve control (Timer setting with PLC is unnecessary)

Allows sharing of switch/valve power supply, and single line for suction signal (Valve wiring is unnecessary)

Timer can be easily adjusted without programming (Reduction of the load of PLC)

## Series ZMA

## 4 Precautions

IBe sure to read before handling. Refer to pages 13-15-3 to 13-15-4 for Safety Instructions and Common I Precautions on the products mentioned in this catalog, and refer to page 13-1-5 for Precautions on every series.

## Mounting

## $\triangle$ Warning

1. Do not drop or bump.

Do not drop, bump or apply excessive impact ( 1,000 $\mathrm{m} / \mathrm{s}^{2}$ ) when handling. Even if the switch body is not damaged, the switch may suffer internal damage that will lead to malfunction.
2. Hold the product from the body side when handling. The tensile strength of the power cord is 49 N , and pulling it with a greater force can cause failure.
3. When handling the product, never move or loosen the switch assembly or the switch assembly mounting screws.

## Wiring

## Warning

1. Do not allow repeated bending or stretching forces to be applied to lead wires.
Wiring arrangements in which repeated bending stress or stretching force is applied to the lead wires can cause broken wires.

## Pressure Source

## $\triangle$ Warning

1. Vacuum pressure switches

There will be no change in performance if a pressure of approximately 0.5 MPa is applied momentarily (when releasing vacuum), but care should be taken that pressures of 0.2 MPa or more are not applied on a regular basis.

## Operating Environment

## © Warning

1. The product cannot be used in a strong magnetic field.

## Vacuum Ejector Specifications

| Fluid | Air |
| :--- | :---: |
| Max. operating pressure | 0.7 MPa |
| Max. vacuum pressure | -84 kPa |
| Supply pressure range | 0.25 to 0.55 MPa |
| Operating temperature range | 5 to $50^{\circ} \mathrm{C}$ |
| Suction filter | Polyethylene sintered metal $(30 \mu \mathrm{~m})$ |

## Valve Specifications

| How to operate | Pilot type |
| :--- | :---: |
| Main valve | Poppet |
| Effective area (Cv factor) | $3 \mathrm{~mm}^{2}(0.17)$ |
| Operating pressure range | 0.25 to 0.6 MPa |
| Electrical entry | Plug connector |
| Max. operating frequency | 5 Hz |
| Voltage | 24 VDC |

## Vacuum Switch with Timer Specifications (for controlling solenoid valve)

| Power source | Operating voltage | 24 VDC $\pm 10 \%$ |
| :--- | :---: | :---: |
|  | Consumption current per one unit | 1.1 W (at switch output OFF) |
| Sensor switch <br> output | Number of output | 1 |
|  | Output | NPN/PNP open collector |
|  | Setting trimmer | 3 turns |
|  | Operation indicator light | Red LED lighting |
|  | Temperature characteristics | $\pm 3 \%$ FS or less |
| Part of timer | Hysteresis | $3 \%$ FS or less (fixed) |
|  | Timer period | 20 to 2,000 ms |
|  | Setting trimmer | 3 turns |
|  | Temperature characteristics | $\pm 3 \%$ FS or less |

## Timing Chart

Note) When power is supplied, release output is performed once for the time period only.

How to Read Flow Characteristics Graph

Flow characteristics are expressed in ejector vacuum pressure and suction flow. If suction flow rate changes, a change in vacuum pressure will also be expressed. Normally this relationship is expressed in ejector standard use.
In graph, Pmax is max. vacuum pressure and Qmax is max. suction flow. The valves are specified according to catalog use. Changes in vacuum pressure are expressed in the below order.
Changes in vacuum pressure are expressed in the order below.

1. When ejector suction port is covered and made airtight, suction flow is 0 and vacuum pressure is at maximum value (Pmax).
2. When suction port is opened gradually, air can flow through, (air leakage), suction flow increases, but vacuum pressure decreases. (condition $\mathrm{P}_{1}$ and Q1)
3. When suction port is opened further, suction flow moves to maximum value (Qmax), but vacuum pressure is near 0 . (atmospheric pressure).
When vacuum port (vacuum piping) has no leakage, vacuum pressure becomes maximum, and vacuum pressure decreases as leakage increases. When leakage value is the same as max. suction flow, vacuum pressure is near 0 . When ventirative or leaky work must be adsorbed, please note that vacuum pressure will not be high.
